

Link-in-Case

Instant connectivity whenever you need it!

Connectivity solutions that can be deployed in minutes – a growing demand in today's fast-paced world

When a disaster strikes, whether small or large, one of the first issues to address is re-establishing communications – and time is always a critical factor. The real challenge of a systematic recovery plan is access to infrastructure components. There are no guarantees that vendors of these critical components will have sufficient stock to support the recovery efforts of every operator and agency.

When Hurricane Katrina struck, RADWIN supplied its radios to the local telephone company to help rebuild the communications network. They were able to utilize the OFDM technology to establish connections in non-line-of-sight situations and get vital communications back on line. As a result of this experience, RADWIN learned how critically essential it was to have everything necessary to install the link right there, ready to deploy!

RADWIN decided to create the Link-In-Case for all types of disasters. Everything necessary – 2 radios with integrated antennas, 2 indoor units with T1 connections plus Ethernet and 2 CAT5 cables with the correct terminations to connect the radios with the indoor units. All of these components are housed in a rugged, water-proof, light-weight case on wheels. The radios are preconfigured for installation and can be aligned in a matter of minutes, utilizing RADWIN's unique audio alignment system – the radios "tell" you when they are aligned. Therefore, it really is fast and easy to install.

Where can the Link-In-Case be utilized? Anywhere there is a need for communications -whether it's ensuring public safety and saving lives after a storm, or putting in a temporary T1 to a cell tower to start revenues flowing, or getting service to the new school for the well-being of the children, while the cable job is being worked.
